Executive Summary

Fish Ageing Services (FAS) is contracted by the Australian Fisheries Management Authority (AFMA) to provide age and associated length data for species caught in the Southern and Eastern Scalefish and Shark Fishery (SESSF). In 2016/2017 samples of otoliths and vertebrae were received from the Integrated Scientific Monitoring Program (ISMP). This report provides a status update on the age estimation of the nominated species required for ageing during 2016/17 and provides a summary of the registration and ageing data generated over the full duration of this project.

For the period 1st August, 2014 to the 30th May 2017, a total of 41,063 otolith and vertebrae samples from 35 different species were registered with in the FAS sample record database. Of these 12,218 were from the 2016 calendar year. Collection targets for the 2016 calendar year were exceeded for five priority species within the SESSF. More specifically, collection targets were exceeded in the SETF for Danish Seine caught School Whiting, Orange Roughy and trawl caught Tiger Flathead. In the GABTF, the collection target was exceeded for Deepwater Flathead. In the GHATF the collection target was exceeded for Gummy Shark.

Over the duration of this project a total of 33,547 age estimates were made from SESSF species collected between August 1st, 2014 to December 31st, 2016 and from historical collections of otoliths collected prior to the commencement of this project. During the 2016/17 financial year a total of 11,613 otolith samples from 5 species were prepared and aged. This number includes historical samples of School Whiting, Gummy Shark, Orange Roughy, Bight Redfish and Deepwater Flathead. The resultant and age frequencies are reported separately for each species with estimates of ageing precision. For Deepwater Flathead and Bight Redfish, where only samples collected in the 2016 calendar year were aged, the length and age frequency of the previous year's ageing are also included in this report for comparison.

Key words: otolith, vertebrae, age, SESSF, ISMP, FAS

Acknowledgments

Acknowledgment is due to the Integrated Scientific Monitoring Program (ISMP) staff of AFMA, Fishwell Consulting and CSIRO Atmospheric Research Hobart for providing otolith pairs, and to the SESSF fishers and processors for supporting this research via provision of samples where necessary. We would also like to thank CSIRO again for allowing the historical collection of shark vertebrae to be archived at their facility. The funding for this work was provided by AFMA.

Background

In August 2014, Fish Ageing Services Pty Ltd (FAS) was contracted by the Australian Fisheries Management Authority (AFMA) for the duration of three years to provide age and related length data for species caught in the Southern and Eastern Scalefish and Shark Fishery (SESSF). The main objective of the project was to provide age and associated length profiles of SESSF species routinely sampled by the Integrated Scientific Monitoring Program (ISMP).

Need

The continued ageing of otoliths and associated analysis of length-frequency data contributes to the timeseries of data held for this fishery, and improved stock assessments. Improved assessment provides for a more detailed understanding of the dynamics and status of fish stocks, enabling AFMA to better meet ESD objectives. Characterising the status of a fishery reduces the need for a highly precautionary approach to prevent overfishing.

This final report was prepared to provide management with details on the numbers of otoliths collected and aged relative to the required targets for the 2016 calendar year and to provided summaries of the otoliths/vertebrae registered and aged for all years of this project.

Objectives and Milestones

The objectives of this project are:

- To prepare and examine the otoliths (teleosts) and vertebrae (shark) samples provided by AFMA observer program in a manner that is consistent with the standardised methods and procedures used in the past.
- To provide age estimate data for the priority species across relevant sectors of the SESSF.
- To document the methods and procedures used (including quality control protocols), and to record the level of compliance with those methodologies in the milestone and final reports.
- To provide ageing information to AFMA via scheduled progress reports and annual reports.
- To attend SESSF Rag Assessment Group (SESSFRAG) meetings and any further relevant RAG meetings (as deemed appropriate by AFMA).
- To store and report on ageing data in a manner that is consistent with existing formats to ensure compatibility with historical records.
- To archive current and historical otolith and vertebrae samples in a manner that is consistent with existing formats to ensure access and re-examination at any point in time.

To provide age composition data and analysts for stock assessment and research purposes.

Milestones

Progress to achieving this project's objectives is measured by the completion of milestones, which were outlined in the contract. The following milestones have been set for this project:

Milestone 1 (August 1st 2014) - Achieved

At the start of the contract provide all historical SESSF ageing data and otolith archive list to AFMA/RAG's

Milestone 2 (December 20, 2014) – Achieved

End of 2014 Calendar Year Report - Provide update of otolith collections and status of ageing for 2014 calendar year (Jan-Nov) and prepare a proposed ageing plan for the 2015 stock assessment cycle.

Milestone 3 (May 31, 2015) - Achieved

2015/16 End of Financial Year Report - Report on the final collections for the 2014 calendar year and present results on the species identified in the agreed ageing plan.

Milestone 4 (December 20, 2015) - Achieved

End of 2015 Calendar Year Report - Provide update of otolith collections and status of ageing for 2015 calendar year (Jan-Nov) and prepare a proposed ageing plan for the 2016 stock assessment cycle.

Milestone 5 (May 31, 2016) - Achieved

2015/16 End of Financial Year Report - Report on the final collections for the 2015 calendar year and present results on the species identified in the agreed ageing plan.

Milestone 6 (December 20, 2016) - Achieved

End of 2016 Calendar Year Report - Provide update of otolith collections and status of ageing for 2016 calendar year and prepare a proposed ageing plan for the 2017 stock assessment cycle.

Milestone 7 (15 May, 2017) - Achieved

Draft Final Report - Integrated final report summarising the collections and ageing work undertaken for the duration of the project, including detailed summaries of the 2016 calendar year data.

Milestone 8 (31 May, 2017) - Current

Final Report submitted.

This report fulfils FAS obligations for the Milestone due 31st May, 2017. This report summarises progress to date specifically:

- Input collection information and biological data into database for samples received for the 2016 calendar year.
- Age and length frequency data reporting for SESSF priority species caught in the 2016 calendar year that were supplied to FAS and were considered a priority for ageing.
- Age and length frequency data reporting from historical gummy shark, School Whiting and Orange Roughy collections of vertebrae and otoliths.
- Registration and ageing summaries for the calendar years 2014-2016 and the age and length frequencies for each calendar year by species and sector/fishery.

Methods

Age reading plan for 2016 otolith collections

Sector targets for 2016

Table 1 details the otolith ageing targets for each priority species in each fishery sector. These numbers are based on the analysis of optimum sample size for age (Krusic-Golub *et al*, 2008).

The actual 2016/17 ageing plan was developed in consultation with AFMA and the various SESSF working assessment groups throughout the 2016/17 financial year. It is developed with consideration of the priorities discussed during the 2016 resource assessment meetings and the estimated numbers of otoliths that will be available for each species.

It was agreed that the following SESSF species were considered as priority for ageing;

Tier 1 Assessment Species 2017 - High Priority

- Gummy shark
 - Ageing historical and current samples (approximately n=3500)
- Orange roughy
 - Age samples from otoliths collected during the 2012 and 2016 AOS surveys (n=1635)
- Bight Redfish
- Deepwater Flathead
- School Whiting
 - Re-age as samples from many years between 1992 and 1997 as possible using sectioned otoliths; up to a total number of 4600
 - o Age approximately 500 samples from 2016

Tier 3 Assessment Species 2017 - High Priority

• John Dory (age all samples collected since late 2014)

As a consequence, the 2016/17 ageing work plan (Table 2) was developed based on these priorities and the numbers of otoliths available at that time.

Table 1. Number of otoliths required for age estimation by each species and sector.

Sector	Species	Gear / Stock	Target
SETF	Blue grenadier	Non-Spawning	900
		Spawning	1200
	Blue warehou	Eastern	450
		Western	450
	Blue-eye trevalla	Trawl	550
	Gemfish	Eastern	650
		Western	500
	Hapuka		400
	Jackass Morwong	Eastern	600
		Western	600
	Ling	Trawl	800
	Orange Roughy		1000
	Redfish		800
	Ribaldo		300
	School Whiting	Danish seine	290
		Trawl	290
	Silver Warehou		900
	Tiger Flathead	Danish seine	700
		Trawl	450
GHATF	Blue-eye Trevalla	Hook	800
	Hapuka	Hook	400
	Ling	Hook	800
	Ribaldo	Hook	300
	School Shark		500
	Gummy Shark		500
GABTF	Bight Redfish	Trawl	600
	Deepwater Flathead	Trawl	560
ECDW	Alfonsino	Trawl	600
Total			16,890

Note: the numbers required for ageing in this table can be different to the otolith collection targets for the ISMP. They are driven by the longevity of the species and the amount of age classes usually present in the fishery, whereas the ISMP targets are fisheries and effort driven.

Table 2. Agreed 2016/2017 ageing plan

Sector	Species	2017	Rational
Trawl			
	Alfonsino		No fishing 2015 & 16
	Blue Grenadier	Removed	No fishing by major stake holder 2015 & 16. Only 350 samples for 2016 - do following year
	Blue-Eye Trevalla		
	Blue warehou		
	Tiger Flathead		
	Gemfish - East		
	Gemfish West		
	Jackass Morwong		
	John Dory	580	Tier 3 proposed in 2017 - Age remaining samples from 2014 and 2015 and all from 2016. 338 to be aged from collections 2014-2015. No samples provided so far in 2016
	Mirror Dory		
	Ocean Perch		
	Orange Roughy	1635	Eastern Stock Assessment - Samples from 2012 and 2016 AOS survey
	Pink Ling		
	Redfish	Removed	Tier 1 in 2017 - currently only 31 registered expect no more than 100 so ageing not informative
	Ribaldo		
	School Whiting	4980	Age 2016 samples (380) and various historical otoliths (4600) that were originally aged from whole otoliths.
	Silver Trevally		
	Silver Warehou		
GHAT			
	Pink Ling		
	Blue-eye Trevalla		
	Ribaldo		
	Hapuka		
	Gummy Shark	3655	Completed October 2016
	School Shark

	Deepwater Flathead	500	Complete annual ageing target 2016/17
	Bight Redfish	500	Complete annual ageing target 2016/17
	Gemfish GAB		
	Jackass Morwong		
	Blue Grenadier		
	TOTAL	11850	

Otolith collection

The ISMP provided paired otoliths in envelopes which detailed the biological and capture data for each sample. Vertebrae were supplied to FAS as a frozen core taken from the cervical section of the vertebral column. The core samples usually contained between 3-4 connected vertebrae. They were either contained within individual envelopes or snap locked bags which detailed the biological and capture data of each sample.

Otolith registration

All otoliths received by FAS were registered into a database. Otolith samples arrive at FAS batched by shot or species, which are usually small groups of 20-50 otolith pairs. These are given a sequential batch number by species. All batches supplied by the ISMP from fish sampled in the 2016 year are detailed in Appendix 1. Each sample was assigned a unique specimen number constructed from the following information:

- Species names each species has a unique code.
- Batch number sequential given to each group of otoliths, of a given species, received at FAS
- Sample number sequential number for each fish in a batch indexed at 1.

The concatenation of species code, batch number and sample number allows FAS staff to identify the details of that specimen (e.g. date and area of capture, sex and other biological information).

The biological data from all otolith collections were entered into a database regardless of whether the samples were required for ageing.

Otolith weight

All otoliths were weighed to the nearest 0.001 grams on an electronic balance.

Otolith storage

Otoliths samples were securely and safely stored onsite for current registered pairs and sectioned samples. Secure offsite storage was utilised for sister otoliths, registered otoliths not required in this current ageing year and those for which the ageing process had been completed.

Preparation of otoliths and vertebra for age estimation

Otoliths and vertebrae were prepared and aged according to standard FAS procedures and protocols. The FAS procedures are modified from Morison *et al.* (1998). A full description of the sample preparation, age reading and quality assurance methods used in this project is provided in Appendix 2.

All SESSF species, with the exception of eastern and western gemfish, alfonsino, school and gummy shark, orange roughy and the dory species are aged by reading transverse otolith sections. Gemfish, John and mirror Dory and alfonsino otoliths are read whole. Orange roughy are aged by reading longitudinal sections and School and Gummy shark by reading transverse vertebrae sections.

Transverse Sectioning

Sagittal otoliths were embedded, in rows of four or five (depending on species) with the primordium aligned, in blocks of Polyplex Clear Ortho Casting Resin. Each otolith was sectioned individually on the transverse axis. Four sections, approximately 300 μ m thick, were cut through the otoliths centres with a modified high-speed gem cutting saw with a 250 μ m thick diamond impregnated blade. Sections from each sample were

cleaned, dried and mounted on clear glass microscope slides (50 x 76 mm) under glass coverslips using resin. Using this method up to 5 otoliths can be prepared for ageing at one time.

Longitudinal Sectioning

Otoliths were arranged in two rows of five in blocks of resin using the same techniques as described above. Otoliths were sectioned individually on the longitudinal axis. From each otolith, up to three sections are taken (approximately 350 μ m in thickness) to ensure the primordium of each otolith was included within the section. Sections were cleaned and mounted in the same method used for the transverse sections.

Vertebrae Preparation

To process the shark samples three vertebrae were cut from the frozen core. The tissue was carefully trimmed from each of the vertebrae using a scalpel. When the majority of the tissue had been removed, the vertebrae were immersed in White King Concentrated Bleach. The active ingredients are sodium hypochlorite (10%) solution and sodium hydroxide (1.3%) which bleaches the vertebrae and removes tissue inaccessible via a scalpel. The immersion time varies between five and thirty minutes depending on the size of the vertebrae being bleached. Larger samples require a longer soak time in the solution. After bleaching, the vertebrae were rinsed through a series of three water baths to remove all traces of the bleach solution and then oven dried at 55 degrees Celsius. The cleaned and dried vertebrae were placed in labelled envelopes and stored awaiting further processing when required.

Vertebrae were embedded in the same Polyplex Clear Ortho Casting Resin used for the otoliths. The maximum length of a vertebra in the anterior-posterior axis that can be embedded is 11 millimetres, due to the depth of the embedding mould and the blade clearance on the sectioning machine. Vertebra greater than 11 millimetres in length required one end to be trimmed. A diagonal cut was taken using a hi-speed Dremel© tool using a plastics blade so that the total length of the vertebrae was approximately 10-11 millimetres. A diagonal groove was also cut at one end of each vertebra to allow resin to flow into the lower articular face. Vertebrae were then embedded in two rows of four with the articular face upwards.

Blocks containing vertebrae were then sectioned, and mounted using the same techniques described for transverse otolith sections.

Reading of otoliths

Transverse and longitudinal sections

Transverse sections were viewed with Leica M80 stereo dissecting microscopes using transmitted light. Magnification was species dependant and ranged between 7.5x to 63x magnification.

Whole otoliths

Whole otoliths were immersed in water and viewed against a black background with Leica M80 stereo dissecting microscopes using reflected light.

Transverse vertebrae sections

Slides of sectioned vertebrae were examined using a Leica M80 stereo dissecting microscope using reflected light delivered from a fibre optic Leica light source (CLS 150 XE). Samples are examined at a magnification of 0.75 times.

Quality Assessment/Quality Assurance

Prior to the commencement of ageing the current year's samples, readers complete a competency reading (or calibration reading) by reading between 50-150 samples selected from a calibration set. The calibration set is a selection of samples/slides that have previously been aged and the results of the aging accepted. The two estimates are compared and a measure of accuracy (Intra average percentage error) is estimated. From the paired age readings, regression plots of age 1 against age 2 are produced. If the precision estimates are within predetermined limits and there is no evidence of bias, then the reader is free to start reading the current (new) set of samples. If the reader fails the competency test then they are re-trained and re-tested until they produce results within the acceptable limits.

To determine precision within the new readings and to test for reader drift, for each species a total of 25% of the samples originally aged were selected and re-read a second time. The intra average percentage error (IAPE) is estimated and the precision is investigated by the examining age difference tables and age bias plots. Again, if the precision and bias it deemed to be unacceptable the reader is re-trained, re-tested before the whole set is re-read. Age estimates are only accepted once the re-reads indicate that there is no bias between readings and the ageing precision is within accepted limits.

Results

Otolith and vertebrae registration

A total of 12,218 otolith samples from 25 different species collected by the ISMP SESSF during 2016 were registered in the FAS database (Appendix 4 – SETF collection by species, sector, zone and stockAppendix 7 – High Seas by species.).

Otolith and vertebrae registration of priority species

For the 2016 calendar year 12,218 otoliths and vertebrae were registered by FAS Pty Ltd (Table 3). Of these:

- 9,812 otoliths were sampled from SESSF priority species
 - 8,322 otoliths were sampled from the SETF
 - o 1,361 were from the GHATF
 - 0 were from the ECDW
 - o 1,361 were from the GABT
- A further 496 otoliths were registered from collections of non-priority species within the SETF, 190 from the High Seas (HS), 488 otolith samples from the GABTF and 226 otolith samples from the GHATF.

A total of 1,269 School and Gummy Shark vertebrae have been supplied to FAS and registered. Of these 75% are from those collected in 2016 with the remaining having a date-of-capture in 2015.

Over the duration of this project FAS staff has registered 41,063 otoliths and shark vertebrae. The majority of samples have come from SESSF quota species collected between July 2014 and 30th April 2017; non-quota or non-priority species and historical otoliths collections from AFMA, CSIRO and Australian Antarctic Division (AAD) have also been recorded and archived (Appendix 8 – Total number of SESSF samples registered within each calendar year for the duration of this project.)

Achievement of 2016 collection targets

The 2016 registrations met or exceeded the targets required for ageing for 5 priority species / gear or stock combinations (see Table 3).

- SETF School Whiting
 - o Danish Seine 394 cf target of 290
- SETF –Tiger Flathead
 - o Trawl 834 cf target 450
- SETF Orange Roughy 3043 cf target 1000
- GHATF Gummy Shark
 - o Gill Net 889 cf target 500
- GABTF Deepwater Flathead 862 cf target 500

Percentage of achievement of collection targets for these species ranged between:

- 2.2% to 304.3% for the SETF sector
- 0% to 355.6% for the GHATF sector
- 83.2% to 143.7% for the GABF sector

Collection targets below 50% were reported for:

- SETF: Blue Grenadier (Spawning), Gemfish (Eastern), Blue Warehou (Western), Blue-eye Trevally (Trawl),
 Redfish (Trawl), Jackass Morwong (Eastern and Western) and Hapuka (Trawl).
- GHATF: Hapuka (Hook), Ling (Hook), Blue-eye Trevally (Hook) Ribaldo (Hook) and School Shark (Hook).

Table 3. Number of otoliths registered at FAS from the 2016 collections, by sector and zone compared with the target. Cells shaded green indicate ≥ 75% of the collection target has been met. Cells shaded orange ≥ 50% <75% of the collection target has been met. Cells shaded red indicates < 50% of the collection target has been met. Unshaded cells indicate no target was set for 2016.

Otolith preparation and ageing

To the end of April 2017, all the available samples from the high priority species required for ageing this financial year, other than John Dory and Orange Roughy have been prepared and aged. The John Dory otolith samples collected during between late 2014 and the end of 2016 are all processed and are ready to be aged. While this species was considered priority, there are insufficient funds remaining in the project to allow these samples to be aged. Should FAS be contracted to provided ageing data post June 2017, we would be in the position to do the ageing on this species before the upcoming 2017 assessments. The ageing of Orange Roughy is a complex and time-consuming process. Currently all samples have been prepared and ageing is due to commence 1st June 2017. It is expected that the majority of samples will be aged by the end of June. All age estimates completed prior to the 30th May 2017 will be summarised in the final report. The remaining estimates will be reported in the updated report made available to the SESSFRAG data meeting which is usually scheduled early in the 2017/18 financial year.

For species where the amount collected significantly exceeded the required collection targets, all samples were still registered, their biological data was entered and the samples stored at our offsite storage facility. If required in the future, a representative sample can then be selected for ageing. In total, 10,086 age estimates have been made on otoliths and vertebrae during 2016/17. The majority of these age estimates were from historical samples collected prior to 2016 (Gummy Shark and School Whiting). The remaining 1124 Orange Roughy that have been prepared will be aged by June 30th 2017.

In total 33,547 age estimates from 15 species have been provided over the duration of this project. The numbers of samples aged per financial year is provided in Appendix 9 – Total number of SESSF samples aged by FAS for the duration of the project

Historical School Whiting otolith collection and data aged during 2016/17

Historically School Whiting have been aged using whole otoliths immersed in water and examined under reflected light. It was recognised that this technique tends to under-estimate the older age classes and can in some instances over-estimate younger age-classes. For this reason, FAS has been using sectioned otoliths to determine the age of School Whiting since 2008. Estimates prior to 2008 were made using whole otoliths. As part of this contract, a variation was made to examine the age composition of historical samples. The otoliths used for this component of the study were sub-sampled from the otolith archive. A total of 4,108 samples were aged from sections with year-of-capture from 1991 to 2006 from both trawl and Danish Seine gear type. The selections of these samples are presented in Table 8 and Table 9.

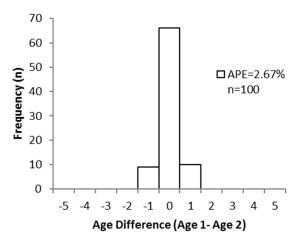

Historical Gummy shark

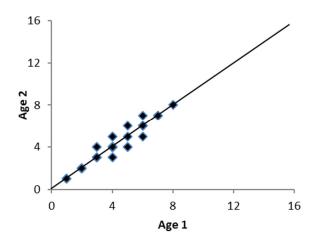

Approximately 9000 gummy shark vertebrae collected between 1994 and 2006 by Terry Walker (previously Department of Environment and Primary Industries, Victoria) were made available to Fish Ageing Services. As a part of the variation to the contract in 2010, sufficient funds were provided to clean a sub-sample of 1600 gummy vertebrae. Of these, a sub-sample was aged from 1995, 1997, 2002 and 2003. These data are presented in Table 19.

Calibration Readings by Species

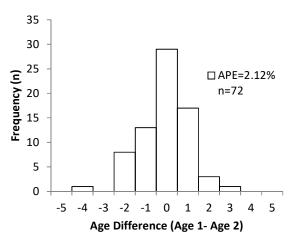

Results of the competency/calibration process for each species, which is completed before any new ageing occurs, is shown below:

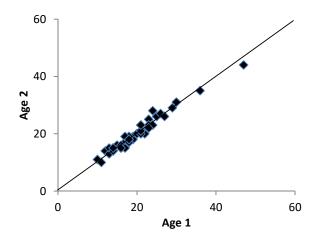

School Whiting (Silago flindersi)

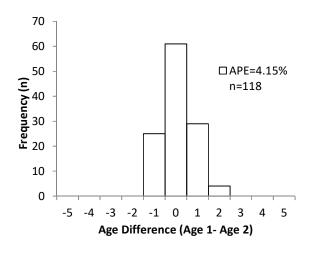

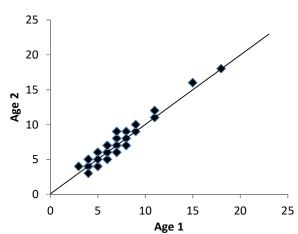

Bight Redfish (Centroberyx gerradi)

Deepwater Flathead (Neoplatycephalus conatus)

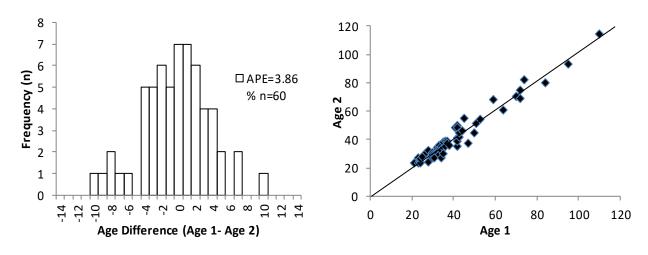

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

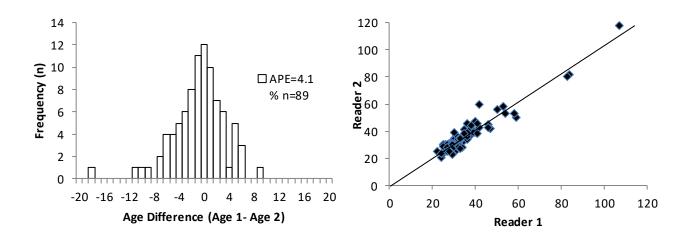

Gummy Shark (Mustelus antarcticus)

This is the first time that these species have been aged in Australia using sectioned vertebrae, as such no calibration set exists. A calibration set will be randomly selected from the aged series presented in this report.

Orange Roughy (Hoplostethus atlanticus)

As stipulated in the Horn *et al* (2016), each time orange roughy otoliths are required to be aged by either Australian or New Zealand, a secondary reader from the other country is expected to read a small subsample. This is to ensure that ageing data between countries is directly comparable and to ensure that precaution is taken to reduce the risk of drift in the interpretation of reading Orange Roughy otoliths. Peter Horn from the National Institute of Water and Atmospheric Research (NIWA) in New Zealand has aged a subset of 100 otoliths from the current sample. Results between the comparison of the competency readings and the comparison between readers (inter calibration) are shown below.

Species Summaries

Presentation of data

Tables of otoliths collected and aged by zone are presented for each species.

Data for each species is represented graphically with age and length-frequencies from the otolith sampled. The length-frequencies reported is only from those otoliths sampled and the age frequencies are from the raw ageing data. Each species is separated by fishery, stock or sector where appropriate and analysis was not split between sexes for any of the species. The numbers of lengths and ages provided in the figures will not necessarily match those in the tables because some samples were provided without length and not all samples prepared could be aged. Precision and accuracy estimates are provided once for each species and are not separated by fishery, stock, sector or sex.

For each species, length and age frequency of the previous year that ageing was completed has been provided for comparison. The age and length frequencies for all other years that ageing data was produced are presented in Appendix 11– Length and age frequencies by species produced during the project (not including 2016).

Precision and accuracy

Repeat reading of 919 vertebrae produced an APE of 3.02% and 70% of the readings agreed, 96% were within 1 year. No bias between readings was observed.

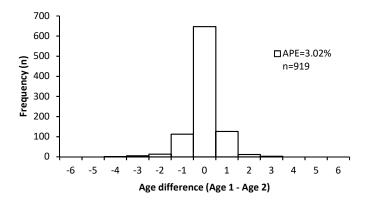

Figure 22. Difference plot for Gummy Shark primary reading (Age 1) minus secondary reading (Age 2).

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

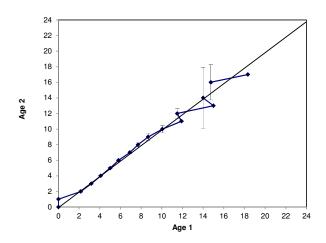

Figure 30. Age bias plot comparing Gummy Shark primary age (Age 1) against secondary age (Age 2). Error bars are 95% CI. Black line indicates the line of agreement.

RAG Attendance

Kyne Krusic-Golub has participated in the following 2016/2017 RAG meetings since the last milestone report (Robertson and Krusic-Golub, 2016) was submitted.

SESSFRAG
 — Western orange roughy workshop – 16th March, 2107.

Recommendations

The ISMP needs to ensure otoliths and vertebrae are sent to FAS in a timely manner in order for ageing to occur within the appropriate timeframe. Some samples are arriving at FAS with missing information like date-of-capture. This is necessary for data integrity for both FAS and reporting to AFMA.

Conclusion

For the duration of this project Fish Ageing Services has registered a total of 41,063 samples and provided 33,547 age estimates. From those otoliths collected by the ISMP during the 2016 calendar year FAS have currently received 12,218 samples of which 9,812 were from SESSF priority species collected throughout the various SESSF zones.

- For the 2016 calendar year collected otoliths targets were exceeded for five priority species / gear / stock combinations.
- Sample targets for the remaining priority species were not met (<100%). Percentage of achievement of collection targets for these species ranged between:
 - 2.2% to 304.3% for the SETF sector
 - 0% to 355.6% for the GHATF sector
 - 83.2% to 143.7% for the GABF sector
- The collection targets for School and Gummy Shark during 2016 were set at 500 per species. During 2016 211 School Shark and 1058 Gummy Shark were sent to FAS, the majority of these samples had a date-of-capture in 2016. These samples have been cleaned and stored according to FAS protocol.

Collection targets below 50% were reported for:

- SETF: Blue Grenadier (Spawning), Gemfish (Eastern), Blue Warehou (Western), Blue-eye Trevally (Trawl), Redfish (Trawl), Jackass Morwong (Eastern and Western) and Hapuka (Trawl).
- GHATF: Hapuka (Hook), Ling (Hook), Blue-eye Trevally (Hook) Ribaldo (Hook) and School Shark (Hook).
- A total of 11,162 age estimates were made from eight different SESSF teleost and elasmobranch species. This number includes historical samples that were aged during the 2016 calendar year from both School Whiting and Gummy Shark. This number only includes samples which were successfully aged, and excludes those that were prepared, examined and unable to be aged (approximately 5%). Of the 11,162 samples aged, 1635 Orange Roughy ages will be completed by the end of June 2017 as part of this project.

Benefits / Management Outcomes

This report has been prepared to provide AFMA with information on the completion of the SETF, GHATF and GABTF otolith collections made between the 1st August 2014 and the 31st May 2017 and to provide a summary of results from the ageing work conducted for the duration of the project.

Appendix 2 - Methods & Standards in Fish Ageing used by FAS

Overview

FAS directors and staff work under the *Occupational Health and Safety Act 2004* and all our methods comply with *Occupational Health and Safety Regulations 2007*. For each method, the appropriate Job Safety Analysis has been completed and the potential risks assessed.

There are no official standards (nationally or internationally) in the field of fish ageing. All the methods that are employed by FAS have been developed over years of experience in the field of fish ageing and are modified from those used at the Central Ageing Facility (Morison *et al* 1998). These methods have been used successfully to age over 250 different species and are internationally recognised.

Many of the processes and protocols developed for the routine ageing of shark and teleosts species used throughout the world were pioneered by FAS Directors. All preparation and reading techniques have been designed for efficiency in preparation time and to maintain consistency within and between readers and species.

Fish Ageing Services Pty Ltd has developed international links with leading researchers in the field of fish ageing and is consistently reviewing best practise in the field of production ageing. FAS use state-of-the-art equipment. The microscopes and dissecting microscopes used are all research grade Leica Microsystems. The software is custom written in Visual Studio.

Sample Extraction

All otoliths and vertebrae samples have been removed from the specimen prior to FAS receiving them.

Sample Registration

All otoliths extracted by or provided to FAS are registered in a database. Each sample is assigned a unique specimen number. The specimen number is constructed from the following information:

- Species names each species has a unique code.
- Batch –number sequential given to each group of otoliths, of a given species, received at FAS
- Sample number sequential number for each fish in a batch indexed at 1.

The concatenation of species code, batch number and sample number allows FAS staff to identify the details of that specimen (e.g. date and area of capture, sex and other biological information).

The biological data from all otolith collections are entered into a database

Otolith weight

All otoliths are weighed to the nearest 0.001g on an electronic balance on registration.

Otolith weight is a useful diagnostic tool in assessing potential errors in age estimates and for examining patterns of otolith growth. Otolith weight has a strong relationship with fish size and age.

In long-lived species, the relationship of otolith weight against estimated age may show an increased slope if the ages have been underestimated. Large variation about the relationship may indicate a lack of precision in the estimates. Also, an outlying data point in the otolith weight/age relationship may indicate incorrect assignment of age and/or length and otolith weight measurements.

Vertebrae Preparation

Vertebrae are supplied to FAS as a frozen core taken from the cervical section of the vertebral column. To prepare these for sectioning, three vertebrae are cut from the frozen core. The tissue is carefully trimmed from each of the vertebrae using a scalpel. When the majority of the tissue has been removed, the vertebrae are immersed in White King Concentrated Bleach. The two active ingredients are sodium hypochlorite (10%) solution and sodium hydroxide (1.3%) which bleach the vertebrae and removes tissue inaccessible via a scalpel. The immersion time varies between five and thirty minutes depending on the size of the vertebrae being bleached. Larger samples require a longer period in the solution. After bleaching, the vertebrae are rinsed through a series of three water baths to remove all traces of the bleach solution. Vertebrae samples are then oven dried at 55 degrees Celsius and placed in labelled envelopes for further processing.

Vertebrae are embedded in the same Polyplex Clear Ortho Casting Resin used for the otoliths. The maximum length of a vertebra in the anterior-posterior axis that can be embedded is 11 millimetres, due to the depth of the embedding mould and the blade clearance on the sectioning machine. Where vertebrae are greater than 11 millimetres in length they are trimmed with a hi-speed Dremel tool using a plastics blade to a length of approximately 10-11 millimetres. A diagonal groove is cut at one end of the vertebra to allow resin to flow into the lower articular face. If the vertebra has been cut down to fit the mould, the end that has been trimmed is cut diagonally. Vertebrae are then embedded in two rows of four with the articular face upwards.

Blocks containing vertebrae are then sectioned, and mounted using the same techniques described for transverse otolith sections.

Otolith storage

Otoliths are stored in four forms:

- 1. Sectioned otoliths
- 2. Sister otoliths
- 3. Otoliths registered but not required for ageing during current project
- 4. Historic otoliths not registered in database.

Samples required for active projects

Otoliths and Vertebrae samples are securely and safely stored, reducing the risk of irretrievable loss, as samples cannot be collected retrospectively.

A fireproof cabinet provides a secure onsite store for:

1. Registered Otolith pairs and dried vertebrae.

Samples are stored onsite until it is sectioned and used for ageing.

2. Sectioned and read samples

Sectioned samples are stored onsite for one year after ageing.

Archival store

Secure offsite storage is used for:

1. Sister otoliths/vertebrae

Once samples have been prepared (i.e. sectioned or aged) the remaining sample from that specimen are moved to an offsite secured storage facility.

2. Registered otoliths not required in current project/year

If samples are identified as not required in the current project these samples are moved to off-site secure store.

3. Historic otoliths not registered in database

Historic otoliths are archived (species, area of capture and year) and then removed to the off-site secure store

4. Sectioned otoliths

After 12 months the slides of sectioned otoliths are moved to the offsite store.

5. Otoliths and sections can be returned to the original client at any time.

The off-site storage facility provides:

- Alarmed pest controlled units.
- 24-hour access
- 24hr / 7-day CCTV camera surveillance
- Pin coded access.

Preparation of otoliths

There are three types of otolith processing that is employed by FAS; transverse otolith sectioning, longitudinal otolith sectioning and whole otolith reads.

Transverse Sectioning

Sagittal otoliths are embedded, in rows of four or five (depending on species) in blocks of Polyplex Clear Ortho Casting Resin ensuring that the primordium of each otolith is line. Each otolith is sectioned individually on the transverse axis. Four sections, approximately $300\mu m$ thick, are cut through the otoliths centres with a modified high speed gem-cutting saw with a $250\mu m$ thick diamond impregnated blade. Sections from each sample are cleaned, dried and mounted on clear glass microscope slides ($50 \times 76 \text{ mm}$) under glass coverslips using resin. Using this method up to 5 otoliths can be prepared for ageing at one time.

Longitudinal Sectioning

Otoliths are arranged in two rows of five in blocks of resin using the same techniques as described above. Otoliths are sectioned individually on the longitudinal axis. From each otolith, up to three sections are taken (approximately 350µm in thickness) to ensure the primordium of each otolith was included within the section. Sections were cleaned and mounted in the same method used for the transverse sections.

Age Reading

Whole otoliths

Reading whole otoliths requires the otolith to be immersed in water against a black background and viewed with reflected light.

Sectioned otoliths

Sectioned otoliths are examined using transmitted light. Each section of the otolith is inspected, and the section with the clearest zone pattern is chosen for ageing. This is usually, but not necessarily the section closest to the primordium (the biological centre of the otolith).

Sectioned Vertebra

Slides of sectioned vertebrae are examined using a Leica M80 stereo dissecting microscope using reflected light delivered from a fibre optic Leica light source (CLS 150 XE). Samples are examined at 0.75 x magnification. The position of each zone is marked on the image along the articular face of the vertebra.

Counts and Measurements

The age of a sample is determined by counting the sequence of alternating translucent and opaque zones from the primordium to the otolith edge.

Otoliths are read using research grade Leica microscopes. Annual age estimates for most species are made using a dissecting microscope. Otoliths prepared for daily age reading are viewed at magnifications up to 63x using a compound microscope.

To avoid the introduction of bias, the magnification at which otoliths are read usually remains consistent within a species. Occasionally, readers will increase or decrease the magnification to resolve the structure of unclear otoliths.

To avoid the potential for biasing age estimates, all counts are made without knowledge of fish size, sex and location. Once age estimates are completed, the ageing data is combined with the biological and capture data for subsequent analyses.

Data acquisition

A customised image analysis system is used to age sectioned and whole otoliths. This system counts and measures manually marked increments and collects an image from each sample aged.

A CCD digital camera is mounted onto the dissecting microscope (Leica MZ80) and a live image is displayed on the monitor. Using the image analysis system, a transect is drawn on the otolith image from the primordium to the edge of the sample. The positions of the opaque zones along this transect and the otolith edge is marked with a screen cursor. Additional structures such as sub-annual zones or transition points can also be marked. The numbers of zones marked and the measurements from the primordium to each subsequent mark along the transect are exported to a Microsoft database.

In addition, the otolith image is automatically captured and exported, along with the x and y coordinates of the marked zones, into an image database. Images are captured in the Joint Photographic Group (JPG) format.

Precision and accuracy

FAS employ worldwide accepted methods for quality assessment/quality control and estimating precision of ages estimated. These methods are consistent with the quality assurance, practices and procedures that are used by other national and international ageing laboratories.

Before the reading of a set of otoliths begins, for each given species a reference set of samples is read. The reference set consists of a sub-sample of previously read otoliths from that particular species. These calibration sets are continuously updated as new samples are aged. Ageing of the samples commences only once an acceptable level of precision and accuracy are achieved (species specific indices). If acceptable levels are not achieved readers are retrained. This provides a measure to ensure that samples are interpreted in the same manner as previously reported.

Repeated readings of otoliths provide measures of intra-reader and inter-reader variability. The purpose of the re-reading otoliths is to provide an indication of error associated with the estimates, not an agreed age. Re-reads do not validate the assigned ages but provide an indication of magnitude of the error to be expected within a set of age estimates. These differences are due to variations in interpretation of the otolith zones.

Beamish and Fournier (1981) developed an index of average percent error (IAPE), which is probably the most widely used method for quantifying this variation.

If the sample of otoliths being aged is less than 100, then the whole sample will be re-read a second time. If the sample size is greater than 100 then a sub-sample of 25% will be re-aged. From the repeat readings an IAPE is calculated and age bias plots, age difference tables and regression analysis are also produced to investigate precision.

A bootstrap technique is applied to individual error estimates to establish confidence intervals around the IAPE. Five thousand data sets (each the same size as the original) will be generated with replacement from the original repeat reading data set, and an IAPE calculated for each group. The mean of these replicate IAPE's is the mean bootstrap IAPE. Confidence intervals around the bootstrapped IAPE are determined by using 5% and 95% quantiles from the array of bootstrapped IAPEs.

Re-read data is combined with relevant biological data and reported to the client (if a standard technical report is requested)

In addition to QA/QC for age estimation, FAS will apply Quality Standards to ensure:

- Sample and data integrity
- The project is delivered on time
- That the project is delivered to the required quality specifications.

Data management and storage

Data management should include a description of the data to be produced by the research and show details on the following aspects:

- Data security or privacy issues, applying to the data.
- Nominated data custodian, clearly identifying the party responsible for this data.

Data is stored using two strategies to prevent loss. These are:

- All data is stored in a network attached Redundant Array of Independent Disks (RAID), configured as RAID 5 storage. This has the benefit that a disk failure within the array does not compromise the data.
- All data is stored off site at <u>www.seekdotnet.com</u> (the service provider for FAS). This protects the data against major disaster (for example, fire or theft).

All ageing data generated through the course of this project will be provided annually to AFMA in the form of a milestone and draft and final end-of-financial year report.

Length-at-age data is the main data generated by FAS. Other information including biological data and sampling details associated with the samples will also be stored. This data will be maintained in Microsoft Access and SQL databases. Access to any data generated through this project will only be provided to third party individuals or organisations with written authorisation by the client.

All data associated with this project will be routinely archived off site to ensure data integrity. Access to these data will be provided on a password protected basis with read-only permissions.

FAS are also able to provide data systems which are compatible with end user's needs. An example of this system includes online data delivery to CSIRO modellers. This innovation was employed in May 2009, when data from the SESSF Ageing work plan 2007–09 was uploaded to a secure website. Registered access, provided by the FAS allowed CSIRO scientists and AFMA managers access this data immediately it completed the Quality Assurance procedure. This innovation ensures a timelier delivery of data than was previously possible.

These systems will be developed by FAS. These systems will be proactively modified tailoring the delivery of results to the target audience. The flexibility introduced by these data systems will enhance the capability of AFMA and the end data users to address issues relating to age composition within SESSF fisheries.

These systems will allow access to the following information:

- Current and historical datasets
- A real-time view of what has been collected and where sampling deficiencies may exist
- Current age composition and raw length-at-age data.

New data systems will continue to be tailored to end user's requirements, including scientists, modellers and managers to provide high data quality and more efficient data delivery. This will be done as part of FAS commitment to providing efficiencies that were previously unavailable using the CAF model of operation.

Data custodian

Simon Robertson is the data custodian. Tailored data reports have been provided throughout the course of this project which includes full metadata descriptions.

Appendix 3 - SESSF collections by sector and zone

Total N	261	2620	3166	9011	7326	11163	33547

Note1: samples aged each financial predominantly consist of those samples collected the previous calendar year, however may also include those age estimates made from archived otoliths prior to the commencement of this project

Note 2. Historical Gummy Shark and School Whiting sourced from a number of years dating back to 1991.

Note 3: The Orange Roughy samples (1635) shown in red have been prepared and the ageing will be completed by June 30th 2017.

Appendix 10. Total number of School and Gummy Shark processed for the duration of the project

School and Gummy Shark collected over duration of the project.

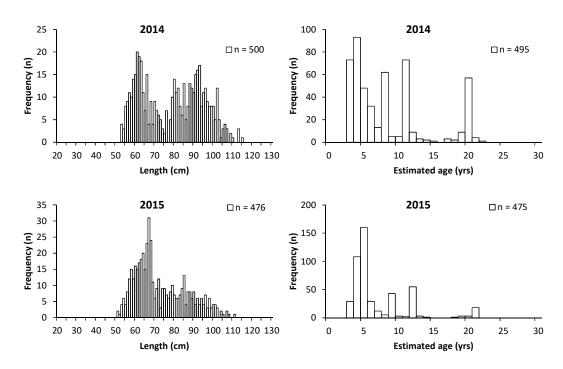

Shark Zone

Appendix 11- Length and age frequencies by species produced during the project (not including 2016).

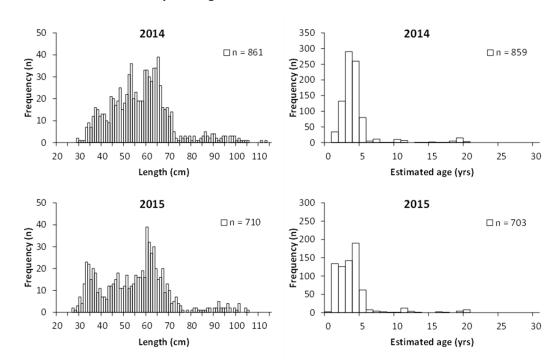

Alfonsino

No ageing completed for the duration of the contract (2015-2017). Last ageing data available from otoliths collected in 2013.

Blue Grenadier - Spawning

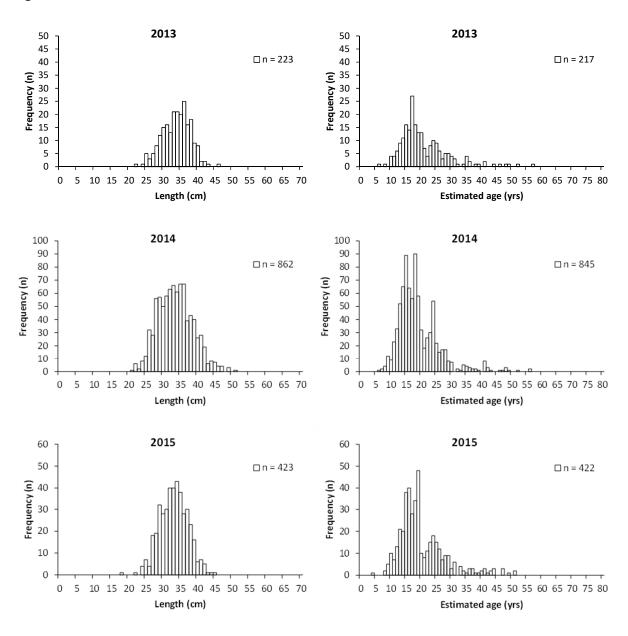

Blue Grenadier - Non-Spawning

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

Bight Redfish

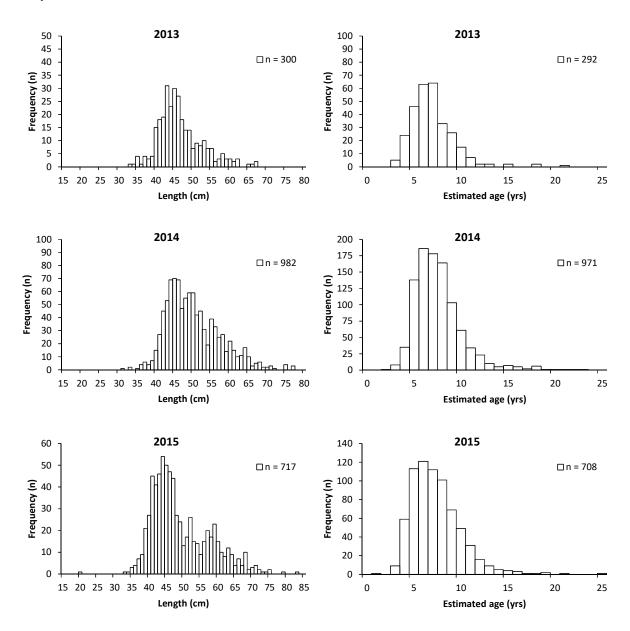

Blue-eye Trevalla

No ageing completed for the duration of the contract (2015-2017). Last ageing data available from otoliths collected in 2009.

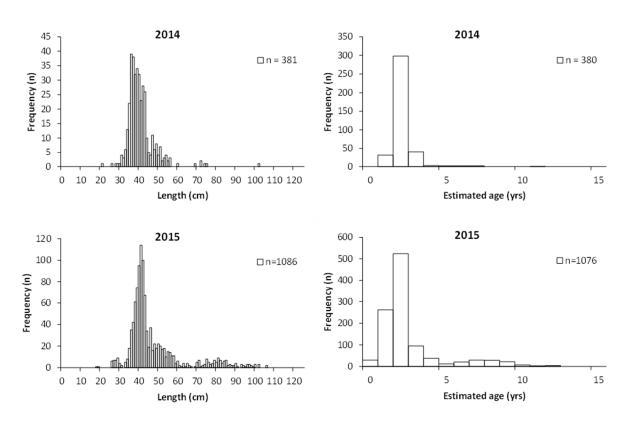

Blue Warehou - Eastern & Western

No ageing completed for the duration of the contract (2015-2017). Last ageing data available from otoliths collected in 2011.

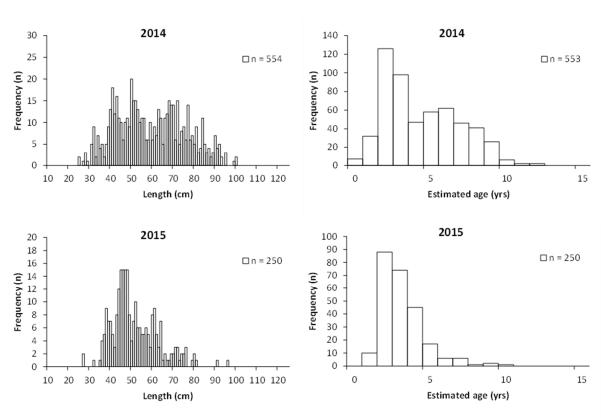

Deepwater Flathead

Eastern Gemfish

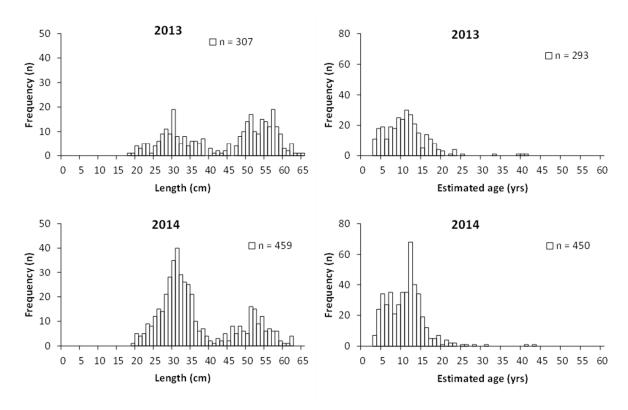

Western Gemfish

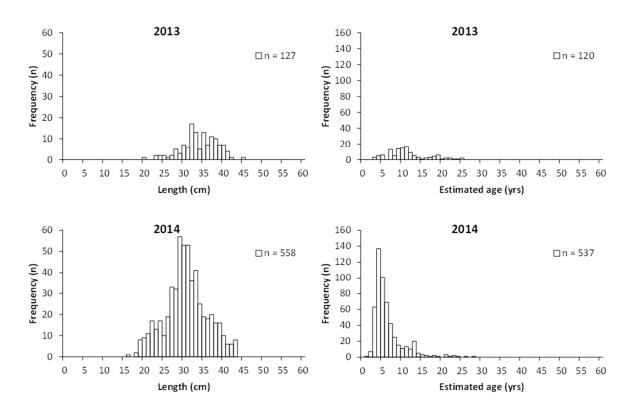

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

Gummy shark
All historical and current ageing completed during 2016/17 and presented in the species summary section.
section.
Hapuka
No ageing completed for the duration of the contract (2015-2017). Last ageing data available from otoliths collected in 2009.

Jackass Morwong - East

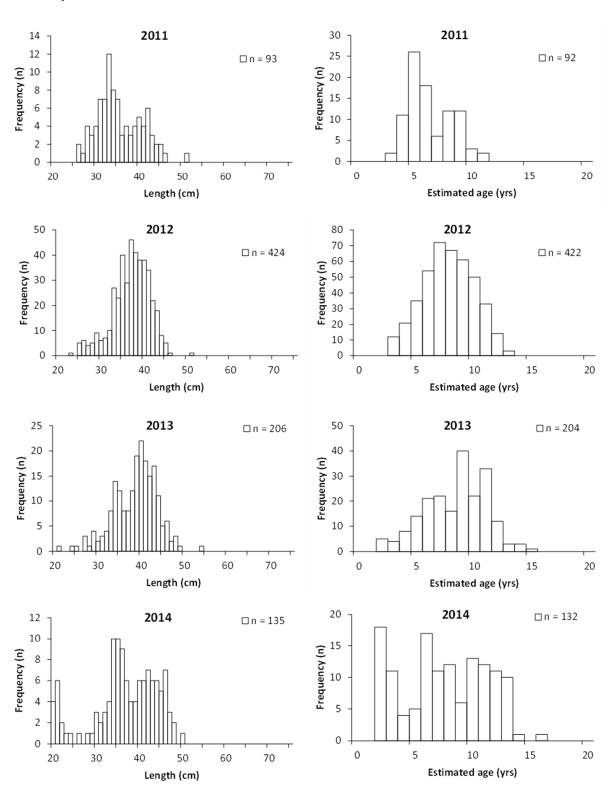

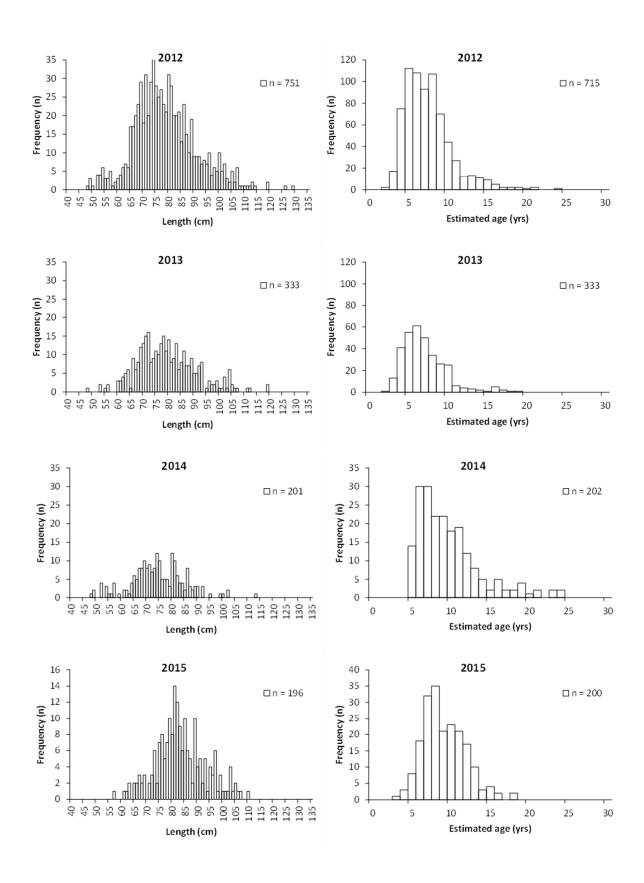

Jackass Morwong - West

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

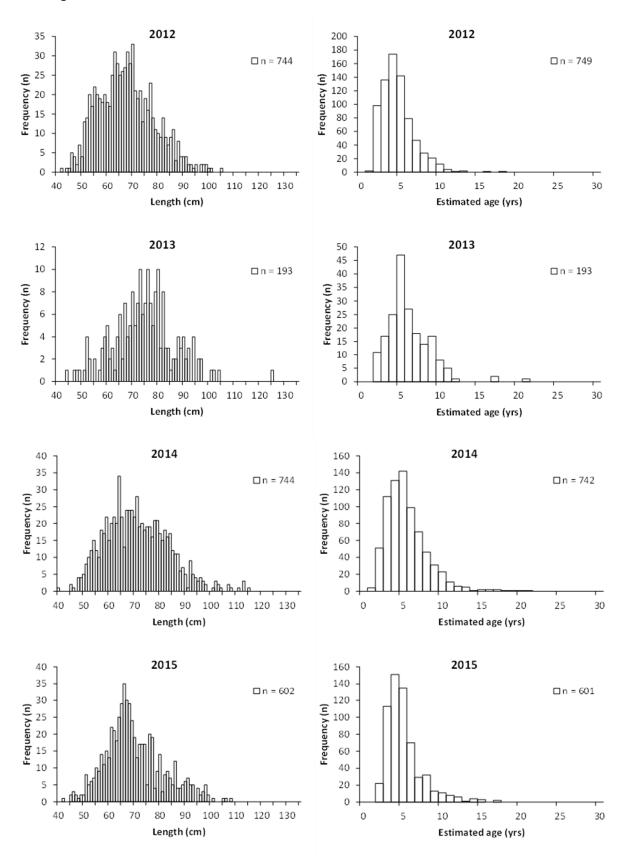

John Dory

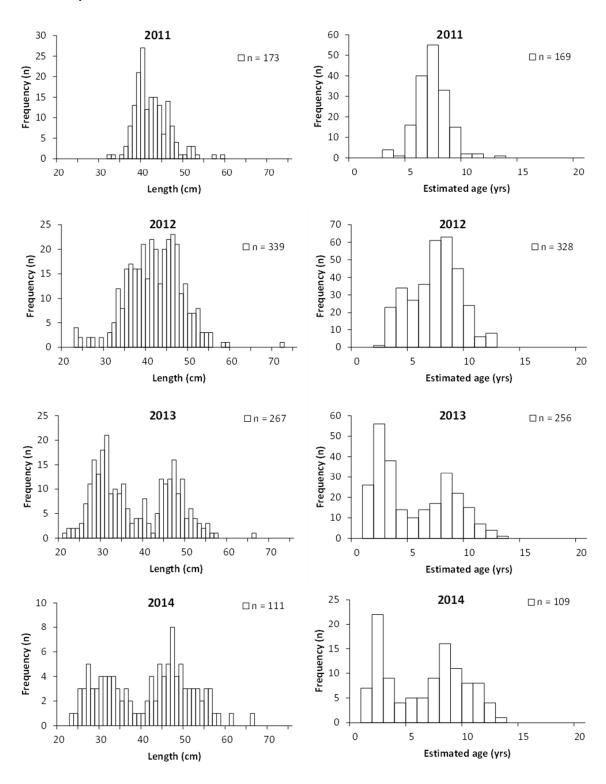

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

Pink Ling - Trawl

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

Mirror dory

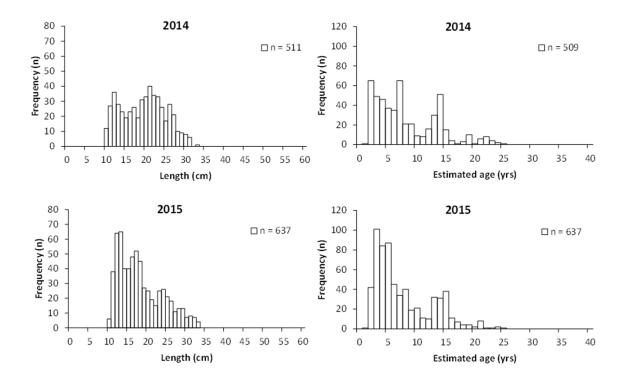

Offshore ocean perch

No ageing completed for the duration of the contract (2015-2017). Last ageing data available from otoliths collected in 2013.

Orange Roughy – Eastern Tasmania

No ageing completed for 2014/5 and 2015/16 of the contract. Ageing being completed late 2016/17.

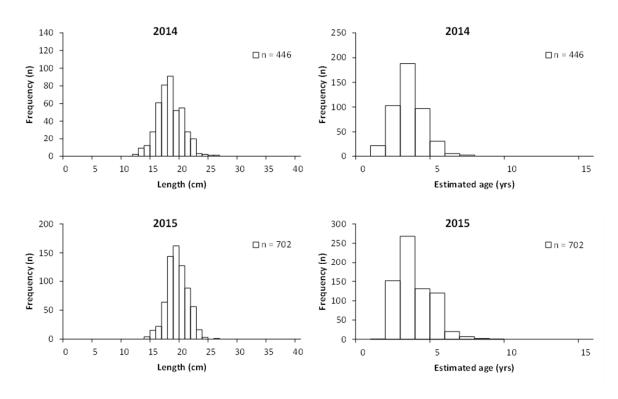

Redfish

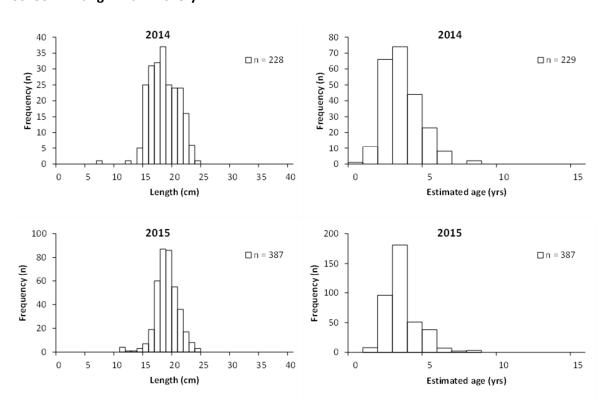

Ribaldo

No ageing completed for the duration of the contract (2015-2017). Last ageing data available from 2007.

School Whiting - Danish Seine

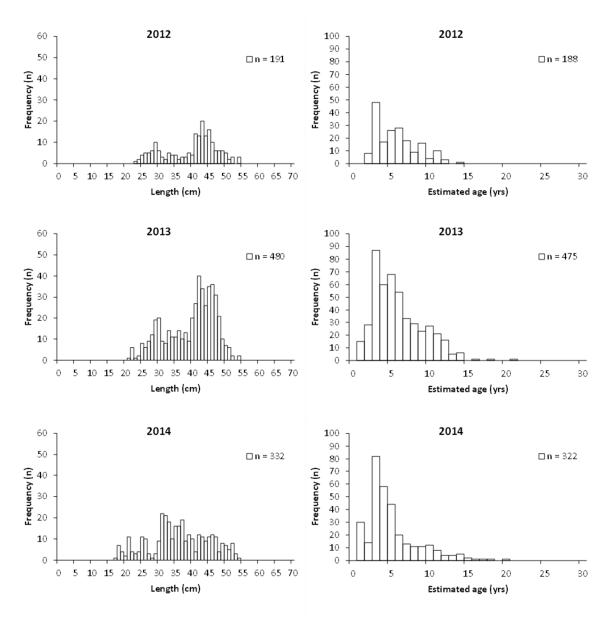

School Whiting - Trawl fishery

Final Report on the age estimation services for the SESSF, 2014-2017. (Milestone 8)

Silver Warehou - Eastern and western

Silver trevally

No ageing completed for Silver Trevally

Tiger Flathead
